Disclosure, Fig 16; 45pp; English

The present invention relates to a method or delivering one or more exogenous genes for expression of the gene in the expiratory of a mammal to give persistent expression of the gene in the epithelial cell, using a lentiviral packaging (expression vector) system.

Also disclosed are (la a recombinant lentiviral packaging system , comprising a flag protein, and a second nucleic acid molecule including a gag gene sequence encoding a Gagpol protein (the gagpol gene sequence encoding a Gagpol protein (the gagpol gene sequence condition and sequence encoding a Gagpol protein (the gagpol gene sequence conditions) which switches expression of the correct the chance of a frame shift which switches expression of the correct encode either the gag gene or the gagpol gene of cagpol protein to the Gag protein in wild type lentiviral vector nucleic acid molecule which does not encode either the gag gene or the gagpol gene of coord, and (ii) a recombinant nucleoted changes in the frame shift capped and which does not encode either the gag gene or the gagpol gene of which which switches sexpression of the Gagpol protein to the Gag protein in the wild type lentivirus. The exogenous gene is expressed in sufficient numbers of condition. The exogenous gene is exprise fibrosis transmembrane conductance regulator (CFTR) and the condition is cystic fibrosis conductance regulator (CFTR) and the condition is cystic fibrosic tential differentiated and is capable of differentiating into 2 or difference has additionally degenerate nucleocide substitutionally degenerate nucleocide substitutionally degenerate nucleocide substitution which the frame shift event. The gag gene is a truncation of the wild type gagol gene so that it can longer be translated to form Gagpol. The method and recombinant lentiviral packaging system may be used for delivering nucleic acids to epithelial cocidies of a mammal. In particular they may be used to delivery of a non-toxic amount of the resembration. gene for the treatment of CF. It has been found that the delivery of a recombinant lentivirus carrying an exogenous gene to the respiratory system, following the delivery of a non-toxic amount of a penetration enhancer can provide persistence of expression of a gene product. The present sequence represents modified HIV-1 GagPol protein. The present invention relates to a method of delivering one or more

mammal an immune response directed to a virus, preferably Human mammal an immune response directed to a virus, preferably Human mammal an immune response directed to a virus, preferably Human (mammalericiency virus (HIV). The method comprises sequentially and recombinant administering to the mammal one or more sequential doses of a recombinant plasmid vector or recombinant viral vector or its derivative, into which the mucheic acid molecules encoding all, part or a modified form of two or more antigens of the virus are incorporated, and one or more optimized CpG motifs, where the antigens have been rendered substantially non-pathogenic. The invention further comprises: a method of vaccinating or preventing viral infection in a mammal; a method of vaccinating or preventing viral infection in a mammal; a wethod of vaccinating a mammal against a viral pathogen; a method of eliciting or inducing an immune response directed to a virus comprising the recombinant viral vector or its functional derivative; a combinant viral vector or its functional derivative; a combinant viral vector or recombinant viral vector; a plasmid vector; a plasmid vector or recombinant viral vector; a plasmid vector; a plasmid vector or recombinant viral vector; a plasmid vector; and recombinant viral vector or recombinant viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eliciting or inducing in a mammal an immune response against HIV-I subtype AB, B or C by administering sequential doses of a recombinant plasmid and viral vectors containing the nucleic acid molecules encoding the HIV antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ramshaw IA;

The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B soluties. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection.                                                                                                                                                                                                                                                                                                                                                                                              The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near [ull-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection. (Updated on 12-SEP-2003 to standardise OS field)

Novel genomic nucleic acids of non-subtype B human immunodeficiency virus type 1 useful for detecting and treating AIDS comprises a specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AACATCATCGGCCGCAACATGCTGACCCAGCTGGGCTGCACCTGAACTTCCCCATCAGC 681
                                                                                                                                                                                                                                                              The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection. The invention relates to molecules comprising HIV-1 subtype isolate regulatory/accessory genes (tat, nef and rev genes) and modifications and derivatives thereof. The invention also provides proteins encoded by such genes. Sequences of the invention are useful for manufacturing vaccines for treating or preventing human immunodeficiency virus (HIV) infections. They are also useful in gene therapy. The present sequence is HIV-1 subtype C isolate Dulis reverse transcriptase (RT) protein. (Updated on 23-0CT-2003 to standardise OS field)

induction of specific humoral and cellular immune responses. (I) and polypeptides (II) encoded by them, are useful in pharmaceuticals, vaccines and diagnostic agents, particularly for treatment or prevention of human immune deficiency virus-I (HIV-I) infections, also for rational design of test or therapeutic reagents, or gene therapy vectors. Polypeptides, especially antibodies, specifically directed against (II) are since similarly useful as pharmaceutical and diagnostic agents. (I) are specific for intersubtype C/B' of HIV-1 so are useful in regions (particularly China and South-East Asia) where this subtype is prevalent. The products of the invention have antiviral activity. This sequence represents a protein encoded by the HIV-1 subtype C genome described in the method of the invention.                                                                                                                  õ
                                                                                                                                                                                              The present invention relates to a process for the selection of human immunodeficiency virus (HIV) subtype isolates for use in the development of a prophylactic and/or therapeutic pharmaceutical composition. The process involves selecting isolated virus or viruses with a high sequence identity to a consensus sequence and a phenotype which is associated with transmission for the particular HIV subtype. The composition can be used in the production of vaccines against HIV. The present sequence is the HIV-1 subtype C isolate Dul51 pol protein. (Updated on 29-AUG-2003 to

                                                         The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, rev, and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection. (Updated on 12-SEP-2003 to standardise OS field)

```

This is the amino acid sequence of the pol protein of lymphadenopathy associated virus LAV.MAL (CNCM I-641), a new virus isolate from Zaire that is responsible for diseases clinically related to AIDS. The sequence was deduced from an open reading frame (ORF) of the LAV.MAL genome (see AAV63467). 7 ORFs (see AAW72992-98) were identified. Specific peptides of the envelope glycoprotein can be used as antigens in a claimed method for the in vitro detection of an antibody directed against LAV. The method is useful for the diagnosis of AIDS or pre-AIDS, or to detect antibodies in patients, asymptomatic carriers and in blood-related products. LAV viral for detecting LAV.MAL; HIV; human immunodeficiency virus; diagnosis; vaccine; AIDS; pol. method and ä

The invention relates to a nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles. The nucleic acid vector is useful in immunizing a subject against HIV infection. This sequence corresponds to a nucleic acid used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       387
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     447
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               507
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles, useful in immunizing a subject against HIV infection.

```
LAV EL I (AAN80436) and LAV MA L (AAN80437) were isolated from the peripheral blood lymphocytes of patients. Different AIDS virus isolates concerned are designated by 3 letters of the patients name. Stable probes including the DNA sequences can be used for detection of the new LAV viruses or related viruses or DNA proviruses in eg. biological samples. The proteins or peptides can be used for detection of antibodies induced in vivo and present in biological fluids. The DNA can also be used for the expression of LAV viral antigens for the prodn. of a vaccine against the detection of proteins related to the LAV viruses, partic. for diagnosis of AIDS or pre-AIDS. The specification describes a method of determining the influence of variation in host genes on selection of microorganisms with protein substitutions. The method comprises typing all individuals of a substitutions. The method comprises typing all individuals of a population of patients infected with a microorganism for at least one selected intrinsic polymorphic marker involved in the host response to the presence of the microorganism. The method is useful for examining selective pressures confronting a wide range of organisms that exhibit pathogenic traits in a host, such as bacteria, improbacterium, viruses and virus-like particles; for examining microorganisms that have adapted to evolve rapidly, including HIV and AIDS related viruses and the heptitis related viruses such as HCV and HBV. The method is useful for designing a vaccine to prevent or delay the emergence of drug resistence in patients treated with a particular drug specific for a microorganism at the nucleotide or amino acid level. The present sequence represents a HIV pol protein, which is expected to provide optimal cytotoxic T lymphocyte (CIL) induced therapeutic protection to the cohort examined in that study

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polyprotein
